In the above network, you are to create 3 routers. In the first Router, which is Router0, you are to connect it to an AP and then further connect multiple wireless devices. In the second Router, Router1, you are to connect wired devices to the switch. And in the third router, which is a wireless router, you have to connect multiple wireless devices.

You are also to consider the following

- Give a new SSID on both Wireless Router and AP
- Provide new wireless password where required
- Assign IP address using DHCP
